

The Avalon organism I have decided to build a model of is the Tribrachidium. Whilst watching the YouTube video “The other explosion you should know about” I was interested by the different Avalon organisms that existed. At first, I was determined to make my model of a Rangeomorph due to its intriguing ability to grow fractally. However, I decided to go with Tribrachidium after I learnt about its fascinating trilateral symmetry, unlike anything alive today. I built the Papier-mâché model by using recycled school worksheets I had collected over the month, painting it and finally adding a few details such as water bottle caps.
